

Phillip Cantu

Full-Stack Web Developer

 thereisphil@gmail.com  phillipcantu  hereisphil  phillipcantu.com

PROFILE

Experienced in React, Node, Python, and SQL/NoSQL, known for clear communication, adaptability, and strong problem-solving. ESL teacher and Army veteran bringing discipline, teamwork, and user-centric thinking to software engineering. I like to write clean code in TypeScript and build MERN-based web apps with good UI/UX + A11y as a focus.

SKILLS

HTML5 | CSS3 | JavaScript | TypeScript | React.js | Next.js | Node.js | Express.js | React Native | Python | Flask | SQL | Postgres | MySQL | SQLite | MongoDB | RESTful APIs | JWT Auth | Git | GitHub | AWS | AGILE Practices | Responsive Design | Accessibility (a11y) | Tailwind | Bootstrap | Linux | Vite | AI Literacy | Clean Code | Claude Code | Cursor AI IDE | ORMs (Prisma / Drizzle) | Cloudflare Workers

EDUCATION

- Bachelor of Science: Web Development, Full Sail University**  10/2024 – Present | REMOTE
Expected graduation December 2026
- AI & Data Science, Flatiron School**  04/2026 – Present | REMOTE
Expected graduation February 2027
- Certificate: Full Stack Development with AI, 4Geeks Academy**  08/2025 – 11/2025 | REMOTE

PROFESSIONAL EXPERIENCE

- Software Engineer Apprentice → Junior Software Engineer, Hgraph**  06/2026 – 09/2026 | REMOTE
- Merged 143+ PRs across 16 different services and packages in under three months, progressing from single-component UI tickets to owning multi-service features end to end.
 - Built enterprise SAML single sign-on, an organization security boundary enforced in RLS and the GraphQL layer, JIT user provisioning, an admin provisioning endpoint, and the customer-facing setup guide, covered by 67 integration tests.
 - Rebuilt the company's AI agent (**hgraph.ai** ) as a full-stack streaming product: a SSE chat backend, a persistent thread store under RLS, org-scoped spend ceilings, and SS credential isolation so API keys never reach the browser.
 - Delivered the customer-facing API usage dashboard from ClickHouse SQL through GraphQL resolvers to the React interface, adding bloom-filter skip indexes and bounded joins so tenant-scoped queries stopped scanning every granule.
- Software Engineering Apprentice, Flatiron School**  04/2026 – 06/2026 | REMOTE
- Selected for Flatiron's paid apprenticeship; worked on a four-engineer remote team under an industry mentor, with all work delivered through pull-request review.
 - Ramped on an unfamiliar production Next.js codebase, then scoped and built new features into it, owning the lesson-planner demo end to end.
 - Co-built MatchPoint from scratch, an AI-powered job-matching app (React/TypeScript, FastAPI/Python, OpenAI embeddings, Supabase Postgres). Personally built the backend scaffold, Supabase auth with Google OAuth, and the core database schema and migrations across 10 merged PRs. **Site**  | **Repo** .
 - Recruited away by Hgraph two months into the 14-month apprenticeship to join their engineering team.

PROJECTS

- App Track – Full-Stack MERN Web Application** , *React, TypeScript, Node.js, Express, MongoDB Atlas, Docker, REST APIs*
- A production-deployed full-stack web application that enables users to securely register, and manage personal job-application opportunities through a modern, responsive interface. Frontend: Vercel.com, Backend: Render.com
- Implemented secure user authentication and session management using express-session, MongoDB-backed session storage, and bcrypt password hashing.
 - Built RESTful API endpoints with protected routes, middleware-based authorization, and structured request/response handling.
 - Deployed the backend as a custom Docker image to Render, configuring environment variables, production CORS policies, and proxy-aware session cookies.
 - Applied responsive UI design using Tailwind CSS, ensuring usability across desktop and mobile devices.
